

# An Introduction to Wavelet Analysis

# 1.FOURIER ANALYSIS

Math.View

- $L^2(0, 2\pi)$  : all measurable functions  $f$ :

$$\int_0^{2\pi} |f(x)|^2 dx < \infty$$

Extend these functions periodically to  $\mathbf{R}$  :  $L^2(0, 2\pi)$  becomes vector space of all functions, period  $2\pi$ , square integrable.

$$f \in L^2(0, 2\pi) \quad \Rightarrow \quad f(x) = \sum_{n=-\infty}^{\infty} c_n e^{inx}, \quad (1)$$

where  $c_n$  are the Fourier coefficients

$$c_n = \frac{1}{2\pi} \int_0^{2\pi} f(x) e^{-inx} dx. \quad (2)$$

Convergence in (1) is in  $L^2(0, 2\pi)$ .

• Two characteristics of (1):

(i)  $f$  is decomposed as an infinite sum of orthogonal components

$$g_n(x) = c_n e^{inx}$$

(ii) the orthonormal basis  $\{w_n(x) = e^{inx}\}$  of  $L^2(0, 2\pi)$  is generated by **dilation** of the single wave

$$w(x) = e^{ix}, \tag{3}$$

that is,  $w_n(x) = w(nx)$ , for all integers  $n$ .

**FACT:** Every periodic function, of period  $2\pi$ , square integrable, is generated by a superposition of integral dilations of the basic function  $w(x) = e^{ix}$ .

## 2. WAVELETS

- Wavelet Uses

signal processing, medical imaging

pattern recognition, data compression

numerical and data analysis

- Tools

wavelet transform

multiresolution analysis

time-scale and time-frequency analysis

best basis analysis

matching pursuit decompositions

•  $L^2(\mathbb{R})$  : all measurable functions  $f$ :

$$\int_{-\infty}^{\infty} |f(x)|^2 dx < \infty .$$

Clearly,  $L^2(0, 2\pi)$  and  $L^2(\mathbb{R})$  are quite different. For the later, functions have to decay to zero at infinity, **so sinusoids do not belong to it.**

We look for "waves" that generate  $L^2(\mathbb{R})$  . These have to decay to zero **fast**. That is, we look for **wavelets** to generate  $L^2(\mathbb{R})$  .

As in  $L^2(0, 2\pi)$  prefer that a **single** function,  $\psi$  , generates  $L^2(\mathbb{R})$  . How to cover  $\mathbb{R}$ , if  $\psi$  has to have fast decay?

**Obvious thing : Translate  $\psi$  along  $\mathbb{R}$ !**

• Let  $Z = \{0, \pm 1, \dots\}$ . The simplest way for  $\psi$  to cover  $R$  is to consider integral translations of  $\psi$ , i.e.,  $\psi(x - k), k \in Z$ .

Consider waves with frequencies partitioned in frequency bands. For computational efficiency, use power of 2 for the partitions. Consider the wavelets

$$\psi(2^j x - k), j, k \in Z.$$

This is obtained from  $\psi(x)$  by a **binary dilation**  $2^j$  and a **dyadic translation**  $k/2^j$ .

Consider an orthonormal basis generated by  $\psi$  :

$$\psi_{j,k}(x) = 2^{j/2} \psi(2^j x - k), j, k \in Z. \quad (1)$$

If  $\psi$  has unit length,  $\psi_{jk}(\cdot)$  also has.

• **Definition:** A function  $\psi \in L^2(R)$  is an orthogonal wavelet if the family defined by (1) is an orthonormal basis for  $L^2(R)$ , i.e.

$$\langle \psi_{j,k}, \psi_{\ell,m} \rangle = \delta_{j\ell} \delta_{km}, \quad j, k, \ell, m \in \mathbb{Z}$$

and any  $f \in L^2(R)$  can be written as

$$f(x) = \sum_{j,k=-\infty}^{\infty} c_{j,k} \psi_{j,k}(x), \quad (2)$$

where convergence in (2) is in  $L^2(R)$ .

The representation (2) is a **wavelet series** and the **wavelet coefficients** are given by

$$c_{j,k} = \langle f, \psi_{j,k} \rangle = \int_{-\infty}^{\infty} f(x) \overline{\psi_{j,k}(x)} dx. \quad (3)$$

## Examples

- Example 2.1: Haar

$$\psi^{(H)}(t) = \begin{cases} 1, & 0 \leq t < 1/2 \\ -1, & 1/2 \leq t < 1 \\ 0, & \text{otherwise,} \end{cases}$$

$$\psi_{j,k}^{(H)}(t) = \begin{cases} 2^{j/2}, & t \in [2^{-j}k, 2^{-j}(k + \frac{1}{2})) \\ -2^{j/2}, & t \in [2^{-j}(k + \frac{1}{2}), 2^{-j}(k + 1)) \\ 0, & \text{otherwise.} \end{cases}$$

- Example 2.2: Daubelets, Symmlets, Coiflets
- Example 2.3.

Morlet(Modulated Gaussian):

$$\psi(t) = e^{i\omega_0 t} e^{-t^2/2}.$$

Mexican hat:

$$\psi(t) = (1 - t^2) e^{-t^2/2}.$$

Shannon:

$$\psi(t) = \frac{\sin(\frac{\pi t}{2})}{\frac{\pi t}{2}} \cos(\frac{3\pi t}{2}).$$

- Scaling Function

$$\phi(t) = \sqrt{2} \sum_k \ell_k \phi(2t - k) \quad (1)$$

Generates orthonormal family of  $L^2(\mathbb{R})$ ,

$$\phi_{j,k}(t) = 2^{j/2} \phi(2^j t - k), \quad j, k \in \mathbb{Z}$$

Mother wavelet can be obtained as

$$\psi(t) = \sqrt{2} \sum_k h_k \phi(2t - k), \quad (2)$$

$$h_k = (-1)^k \ell_{1-k} \quad (3)$$

(1) and (2): **dilation equations**

(3): **quadrature mirror filter relation**

### 3. THE WAVELET TRANSFORM

Discrete wavelet transform(DWT):

$f = (f_1, f_2, \dots, f_T)'$ : discrete signal with  $T = 2^M$ ,  $M > 0$  integer.

The DWT maps  $f$  to a vector of wavelet coefficients

$$w = (s_J, d_J, d_{J-1}, \dots, d_1)', \quad J \leq M$$

where

$$s_J = (s_{J,1}, s_{J,2}, \dots, s_{J,T/2^J})'$$

$$d_J = (d_{J,1}, d_{J,2}, \dots, d_{J,T/2^J})'$$

$$d_{J-1} = (d_{J-1,1}, d_{J-1,2}, \dots, d_{J-1, T/2^{(J-1)}})'$$

$\vdots$

$$d_1 = (d_{1,1}, d_{1,2}, \dots, d_{1, T/2})'$$

$$s_{J,k} = \sum_{t=1}^T f_t \phi_{J,k}(t), \quad k = 1, \dots, \frac{T}{2^J}$$

$$d_{j,k} = \sum_{t=1}^T f_t \psi_{j,k}(t), \quad k = 1, \dots, \frac{T}{2^j}$$

$f_t$  can be obtained by

$$f_t = \sum_k s_{J,k} \phi_{J,k}(t) + \sum_{j=1}^J \sum_k d_{j,k} \psi_{j,k}(t)$$

## 4. MULTIREOLUTION ANALYSIS

# NONPARAMETRIC ESTIMATION WITH WAVELETS

. one of the great success stories of wavelets is in the field of nonparametric statistical estimation.

. wavelet shrinkage: removing noise by shrinking wavelet coefficients towards zero.

. The model:

$$y_i = f_i + \epsilon_i, \quad i = 1, 2, \dots, T$$

where  $\epsilon_i \sim iidN(0, \sigma^2)$

## 1. Choice of Threshold

### (a) Choice of scheme

#### (i) Hard Threshold

$$\delta_{\lambda}^H(x) = \begin{cases} 0, & \text{if } |x| \leq \lambda \\ x, & \text{if } |x| > \lambda. \end{cases}$$

#### (ii) Soft Threshold

$$\delta_{\lambda}^S(x) = \begin{cases} 0, & \text{if } |x| \leq \lambda \\ \text{sign}(x)(|x| - \lambda), & \text{if } |x| > \lambda. \end{cases}$$

- Shrinkage procedure

[1] Take the discrete wavelet transform of the data  $y_1, \dots, y_T$ , leading to the  $T$  wavelet coefficients  $y_{j,k}$ , which are contaminated by noise.

[2] Use thresholds to reduce the coefficients, making null those coefficients below a certain value. Several choices here are possible and we will discuss some of them in the next section. We obtain, in this stage, the coefficients without noise.

[3] Take the inverse wavelet transform of the coefficients in stage [2] to get the estimates  $\hat{f}_i$ .

## 2. Choice of Parameters

- (a) Universal
- (b) SureShrink
- (c) Cross-Validation
- (d) Ogden and Parzen(1996)

$$S_J(t) = \sum_k a_{J,k} \phi_{J,k}(t) \quad \text{Smooth signal}$$

$$D_j(t) = \sum_k d_{j,k} \psi_{j,k}(t) \quad \text{detail signal}$$

$$f(t) \approx S_J(t) + D_J(t) + D_{J-1}(t) + \dots + D_1(t) \quad \text{MULTIREOLUTION DECOMPOSITION}$$

(Orthog. comp. at diff. scales)

Mallat (1989)

Meyer (1986)

Multiresolution decomposition of the doppler signal.

S<sup>+</sup> WAVELETS

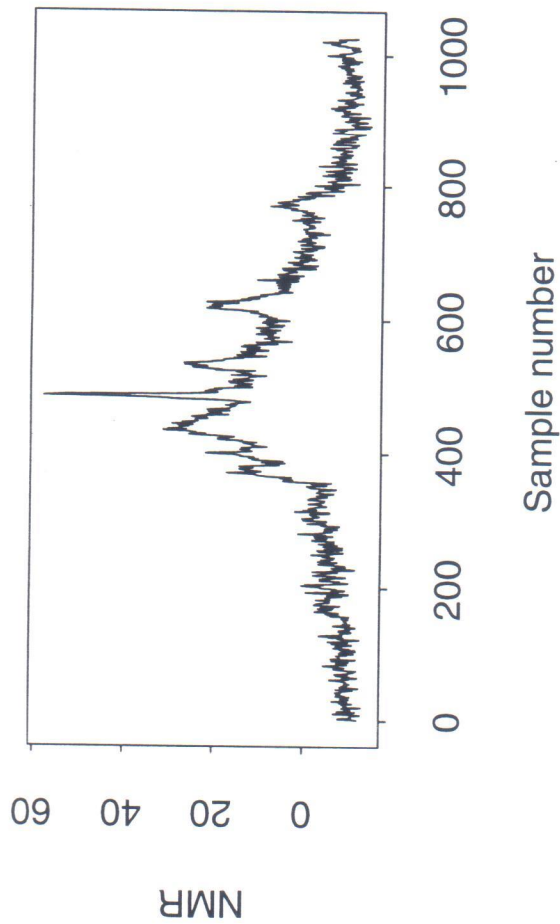

. Theoretical Properties of Wavelet Shrinkage:

for certain choices of the  $\lambda$ , the estimate  $\hat{f}_i$  can almost achieve the *minimax risk* over a broad class of functions  $\mathcal{F}$ :

$$R(\hat{f}_i, f) \approx \inf_{\hat{f}} \sup_{f \in \mathcal{F}} R(\hat{f}, f)$$

Wavelet shrinkage gives nearly the best possible estimate of  $f_i$  making a minimum of assumptions about the underlying nature of  $\mathcal{F}$ .
