## Fatorial recursivo

$$n! = \begin{cases} 1, & \text{quando } n = 0, \\ n \times (n - 1)!, & \text{quando } n > 0. \end{cases}$$

```

def factorial(n)
    '''(int) -> int
    Recebe um inteiro n e retorna n!
    ...
    if n == 0:
        return 1
    return n * factorial(n-1)
  
```

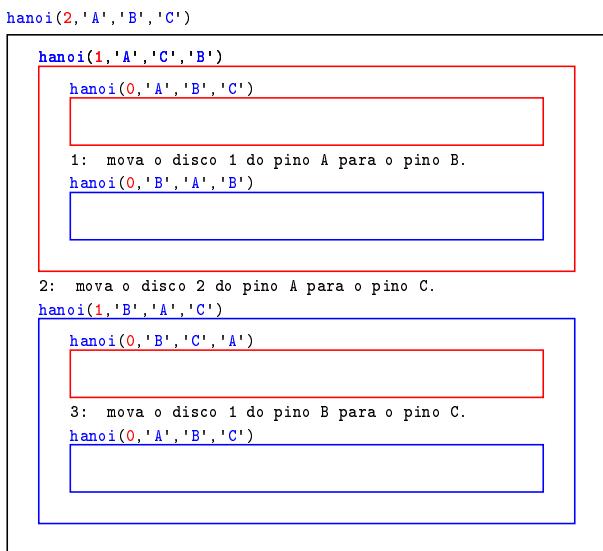

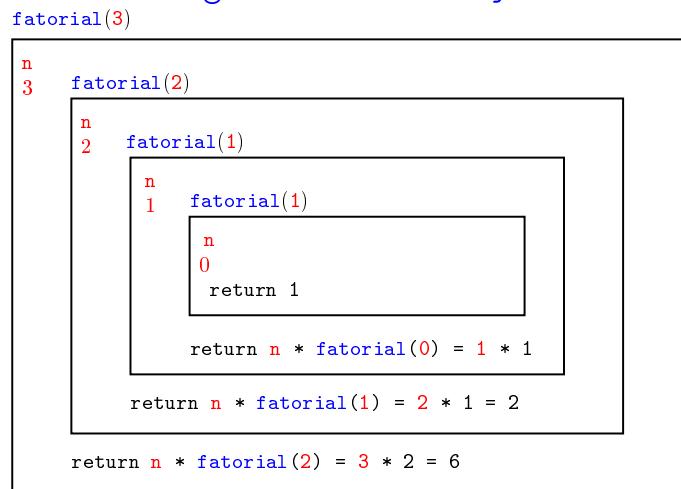

## factorial(10)

```

factorial(10)
factorial(9)
factorial(8)
factorial(7)
factorial(6)
factorial(5)
factorial(4)
factorial(3)
factorial(2)
factorial(1)
factorial(0)
  
```

fatorial de 10 é 3628800.

## Diagramas de execução

## Fatorial iterativo

```

def factorial(n):
    '''(int) -> int
    Recebe um inteiro n e retorna n!
    ...
    ifat = 1
    for i in range(2,n+1): # /*1*/
        ifat *= i
    return ifat
  
```

Em /\*1\*/ vale que `ifat == (i-1)!`
