Números de Fibonacci

$F_0 = 0 \qquad F_1 = 1 \qquad F_n = F_{n-1} + F_{n-2}$

n	0	1	2	3	4	5	6	7	8	9
F_n	0	1	1	2	3	5	8	13	21	34

Algoritmo recursivo para F_n:

```
def fibonacciR(n)
    if n == 0:  return 0
    if n == 1:  return 1
    return fibonacciR(n-1) +
           fibonacciR(n-2)
```

fibonacciR(4)

```
fibonacciR(4)
  fibonacciR(3)
    fibonacciR(2)
      fibonacciR(1)
      fibonacciR(0)
    fibonacciR(1)
  fibonacciR(2)
    fibonacciR(1)
    fibonacciR(0)
fibonacci(4) = 3.
```

Fibonacci iterativo

```
def fibonacciI(n)
    if n == 0:  return 0
    if n == 1:  return 1
    anterior = 0
    atual = 1
    for i in range(1,n,1):
        proximo = atual + anterior
        anterior = atual
        atual = proximo
    return atual
```

Qual é mais eficiente?

```
meu_prompt> time ./fibonacciI.py 10
fibonacci(10)=55
real                       0m0.028s
user                       0m0.024s
sys                        0m0.000s

meu_prompt> time ./fibonacciR.py 10
fibonacci(10)=55
real                       0m0.028s
user                       0m0.024s
sys                        0m0.000s
```

Qual é mais eficiente?

```
meu_prompt> time ./fibonacciI.py 20
fibonacci(20) = 6765
real                       0m0.028s
user                       0m0.024s

        fibonacciR(1)
      fibonacciR(2)
        fibonacciR(1)
        fibonacciR(0)
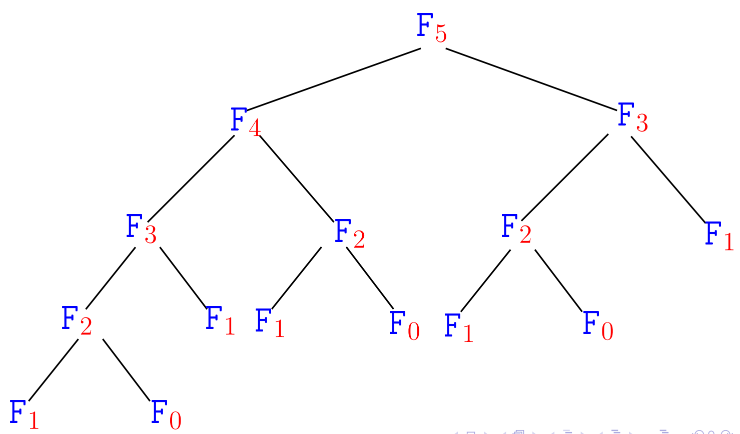
fibonacci(8) = 21.
```

Árvore da recursão

Consumo de tempo é **exponencial.**

fibonacciR resolve subproblemas muitas vezes.



Consumo de tempo

$\mathtt{T}(\mathtt{n})$:= número de somas feitas por $\mathtt{fibonacciR}(\mathtt{n})$

```
    def fibonacciR(n)
1       if n == 0:  return 0
2       if n == 1:  return 1
3       return fibonacciR(n-1) +
4              fibonacciR(n-2)
```

Consumo de tempo

linha	número de somas
1	$= 0$
2	$= 0$
3	$= \mathtt{T}(\mathtt{n}-1)$
4	$= \mathtt{T}(\mathtt{n}-2) + 1$
$\mathtt{T}(\mathtt{n})$	$= \mathtt{T}(\mathtt{n}-1) + \mathtt{T}(\mathtt{n}-2) + 1$

Recorrência

$\mathtt{T}(0) = 0$
$\mathtt{T}(1) = 0$
$\mathtt{T}(\mathtt{n}) = \mathtt{T}(\mathtt{n}-1) + \mathtt{T}(\mathtt{n}-2) + 1$ para $\mathtt{n} = 2, 3, \ldots$

Uma estimativa para $\mathtt{T}(\mathtt{n})$?

Recorrência

$\mathtt{T}(0) = 0$
$\mathtt{T}(1) = 0$
$\mathtt{T}(\mathtt{n}) = \mathtt{T}(\mathtt{n}-1) + \mathtt{T}(\mathtt{n}-2) + 1$ para $\mathtt{n} = 2, 3, \ldots$

Uma estimativa para $\mathtt{T}(\mathtt{n})$?

Solução: $\mathtt{T}(\mathtt{n}) > (3/2)^{\mathtt{n}}$ para $\mathtt{n} \geq 6$.

$\mathtt{n}$	0	1	2	3	4	5	6	7	8	9
$\mathtt{T}_{\mathtt{n}}$	0	0	1	2	4	7	12	20	33	54
$(3/2)^{\mathtt{n}}$	1	1.5	2.25	3.38	5.06	7.59	11.39	17.09	25.63	38.44

Recorrência

Prova: $\mathtt{T}(6) = 12 > 11.40 > (3/2)^6$ e
$\mathtt{T}(7) = 20 > 18 > (3/2)^7$.
Se $\mathtt{n} \geq 8$, então

$$\begin{aligned}
\mathtt{T}(\mathtt{n}) &= \mathtt{T}(\mathtt{n}-1) + \mathtt{T}(\mathtt{n}-2) + 1 \\
&\overset{\text{hi}}{>} (3/2)^{\mathtt{n}-1} + (3/2)^{\mathtt{n}-2} + 1 \\
&= (3/2 + 1)\,(3/2)^{\mathtt{n}-2} + 1 \\
&> (5/2)\,(3/2)^{\mathtt{n}-2} \\
&> (9/4)\,(3/2)^{\mathtt{n}-2} \\
&= (3/2)^2 (3/2)^{\mathtt{n}-2} \\
&= (3/2)^{\mathtt{n}}\,.
\end{aligned}$$

Logo, $\mathtt{T}(\mathtt{n}) \geq (3/2)^{\mathtt{n}}$. Consumo de tempo é exponencial.

Conclusão

O consumo de tempo é da função $\mathtt{fibonacciI}(\mathtt{n})$ é proporcional a $\mathtt{n}$.

O consumo de tempo da função $\mathtt{fibonacciR}$ é **exponencial.**

Exercícios

Prove que

$$\mathtt{T}(\mathtt{n}) = \frac{\phi^{\mathtt{n}+1} - \hat{\phi}^{\mathtt{n}+1}}{\sqrt{5}} - 1 \quad \text{para } \mathtt{n} = 0, 1, 2, \ldots$$

onde

$$\phi = \frac{1+\sqrt{5}}{2} \approx 1{,}61803 \quad \text{e} \quad \hat{\phi} = \frac{1-\sqrt{5}}{2} \approx -0{,}61803.$$

Prove que $1 + \phi = \phi^2$.

Prove que $1 + \hat{\phi} = \hat{\phi}^2$.
